NPZD dynamics Exercises

L5 - Exercises

Debbie, Liv, Peter

29 January 2020

Exercise 1 - NPZD dynamics

Exercise 1.1 Upload the three environmental forcing data (MLD, PAR, and SST). Produce a multi-panel plot using **subplot**.

Exercise 1 - NPZD dynamics

Exercise 1.1 Upload the three environmental forcing data (MLD, PAR, and SST). Produce a multi-panel plot using **subplot**.

Exercise 1.2 Code the NPZD model in python and reproduce the main results, which are reported in the lecture slides. To force the model use the files **sst.dat**, **par.dat**, and **mld.dat**. Try to code each essential process for NPZD system as a separated function.

Exercise 1 - NPZD dynamics

Exercise 1.1 Upload the three environmental forcing data (MLD, PAR, and SST). Produce a multi-panel plot using **subplot**.

Exercise 1.2 Code the NPZD model in python and reproduce the main results, which are reported in the lecture slides. To force the model use the files **sst.dat**, **par.dat**, and **mld.dat**. Try to code each essential process for NPZD system as a separated function.

Exercise 1.3 Plot the results for one year cycle.

Exercise 1 - NPZD dynamics

Exercise 1.1 Upload the three environmental forcing data (MLD, PAR, and SST). Produce a multi-panel plot using **subplot**.

Exercise 1.2 Code the NPZD model in python and reproduce the main results, which are reported in the lecture slides. To force the model use the files **sst.dat**, **par.dat**, and **mld.dat**. Try to code each essential process for NPZD system as a separated function.

Exercise 1.3 Plot the results for one year cycle.

Exercise 1.4 Create a solution for 5 years by repeating the same environmental forcing five times. Plot the solution for the 5 years together with the solution for the last year of the simulation.

Exercise 1 - NPZD dynamics

Exercise 1.1 Upload the three environmental forcing data (MLD, PAR, and SST). Produce a multi-panel plot using **subplot**.

Exercise 1.2 Code the NPZD model in python and reproduce the main results, which are reported in the lecture slides. To force the model use the files **sst.dat**, **par.dat**, and **mld.dat**. Try to code each essential process for NPZD system as a separated function.

Exercise 1.3 Plot the results for one year cycle.

Exercise 1.4 Create a solution for 5 years by repeating the same environmental forcing five times. Plot the solution for the 5 years together with the solution for the last year of the simulation.

Exercise 1.5 (EXTRA) Plot each separated process.

Exercise 1 - NPZD dynamics

Exercise 1.1 Upload the three environmental forcing data (MLD, PAR, and SST). Produce a multi-panel plot using **subplot**.

Exercise 1.2 Code the NPZD model in python and reproduce the main results, which are reported in the lecture slides. To force the model use the files **sst.dat**, **par.dat**, and **mld.dat**. Try to code each essential process for NPZD system as a separated function.

Exercise 1.3 Plot the results for one year cycle.

Exercise 1.4 Create a solution for 5 years by repeating the same environmental forcing five times. Plot the solution for the 5 years together with the solution for the last year of the simulation.

Exercise 1.5 (EXTRA) Plot each separated process.

Exercise 1.6 (EXTRA) Manipulate the parameters to make the spring bloom occurring earlier and later during the year. Visually compare the three solutions in a plot.
